

Are you a talented App Developer with a passion for creating technology solutions that make a real-world impact? Join our team and contribute your skills to a meaningful project aimed at reducing food waste and promoting sustainability in Croatia.

Mission Statement:

Our mission is to reduce food waste and promote sustainability by creating innovative solutions that help individuals and businesses reduce their food waste in Croatia. We believe that by working together, we can make a positive impact on the environment and create a better future for all.

Vision Statement:

Our vision is a world where food waste is minimized, and all resources are used efficiently and sustainably. We strive to be a leading company in the fight against food waste, providing easy-to-use solutions that empower individuals and businesses to reduce their environmental impact. We believe that through our efforts, we can create a more sustainable future for everyone.

How it works:

Restaurant will create coupon for the leftover food and the customers will be able to purchase that coupon over the app.

The mobile app has reached the midway point of its development, and we are seeking the assistance of a skilled student to finalize the remaining tasks and address any lingering issues.

Tasks to do:

Finalization of the app development and pasting text translations in the app (translation is going to be provided to you)

Admin Panel

Webpage (creation of a landing page)

You will get introduced to the codes that have been delivered so far by one of our previous developers. We would look more into details together and determine what we have for now and what is missing.

When we finalized the details, we will need to set up a plan that would consist of all activities that we need to undertake in order to achieve the successful development of MVP with which we can go live into the market. The plan should clearly state the steps and timeline required for each step.

We are going to have follow-up meetings each week to track the progress and help us stay on the same page.

All variables are discussable. Furthermore, if you have any suggestions for the app in terms of design or functionality, please let us know and we can discuss it and also if you think something is not relevant to have in the initial stage, please also let us know. We are open to new ideas 😊

It is important to know the following information:

- Backend is .net core api and the mobile app is react native.
- Price is for discussion
